

Problem 2:

Taylor Impact

Objectives:

1. Understand the difference between Lagrangian and Eulerian kernels
2. Evaluate the effect of support size
3. Validate against experimental data (max length reduction)

To do list:

You are expected to do the following studies by **Beta**:

1. Create a new directory under Example 2 & copy *input_taybar.k*.
2. Obtain results by setting **DX/DY/DZ=1.4 & KERNEL=0**.
3. Create another directory and copy *input_taybar.k*.
4. Obtain results by setting **DX/DY/DZ=1.6 & KERNEL=0**.
6. Plot z-displacement from the time history file "nodout" and compare with test data (max reduction is 6.97mm), evaluate the accuracy of the SPG formulation.
7. Create another directory and copy *input_taybar.k*.
8. Obtain results by setting **DX/DY/DZ=1.6 & KERNEL=1**.
9. Understand and explain the results.
